

1_keywords_Identifiers_Comments

Keywords are reserved words in python and can't use those as variable names, function names or any other identifiers.

Keywords are case sensitive. Example **True** and **true** are not same in python

```
import keyword

print(keyword.kwlist)

print("Total number of keywords:", len(keyword.kwlist))
```

✓ 0.0s Python

['False', 'None', 'True', 'and', 'as', 'assert', 'async', 'await', 'break', 'class', 'continue', 'def', 'del', 'elif', 'else', 'except', 'finally', 'for', 'from', 'global', 'if', 'import', 'in', 'is', 'lambda', 'nonlocal', 'not', 'or', 'raise', 'return', 'try', 'while', 'with', 'yield']

Total number of keywords: 35

Try **False = 1** in the program then it will throw cannot assign to False.

Identifiers are the names given to class, functions, variables and etc. in python. It helps differentiating one entity from another.

- Identifiers can be combination of alpha and numbers
- Identifiers should not start with numbers
- Keywords cannot be used as identifiers
- We cannot use special characters like **!,@,#,%,** etc. in Identifiers.

True@=1 or **1True = 1** --> Invalid syntax

True1=1 --> Accepted

Comments are the lines in the program that are ignored by compiler or interpreter
It is good for code readability for the user.

'#Printing the hello world'

print("Hello World")

For Multiline comments , we can use **#** at start of each line or use triple quotes (**'''** or **"""**)

```
""" This is a
multi line
comments"""
```
